Future Implementations

The following features of the specification were not met due to time constraints regarding the release of the first version of the application. These features are schedule to be implemented after the initial version is approved and core functionality requirements are met.

1. Group History – the ability to view group and user interaction history will allow our users to better tailor their experience on the platform.
2. GPS Integration – currently the application implements a system that uses their zip code and a predetermined radius to match users. Integrating GPS will allow users to find relevant groups more easily, especially if they venture outside of their home zip code.
3. Cellphone and Email Verification – adding this functionality will aid in the recovery of forgotten passwords and lost accounts, while also allowing for additional security through the implementation of dual factor authentication.
4. Team Maker Function – quality of life function that will allow group owners to create any number of teams for the members of their group.
5. User Documentation – An application walkthrough and FAQ section will be provided through the website used to market the application
6. Mobile Application – Mobile application development will be the next area of focus once the desktop application is complete.
